

There are two things to know first:

1. Is the leak coming from in between the window glass and rubber gasket?
2. Is the leak coming from the rubber gasket and body?

You need to remove the window shroud inside the coach and have someone do a water test outside and use a flash light to see where the water is entering. You can also visually see from the inside if you are seeing light passing through which means the window slid down causing a gap.

If the water is entering from glass and gasket, you need to wedge both sides of the glass where the water is entering, wipe it clean and apply windshield urethane black on the gap. Release the wedge and apply force on the outside window glass and tape it and keep it dry. Water test after 24 hours.

If the water is entering from gasket and body, the window has to be removed, check rubber gasket at window and replace if needed, remove old putty tape, clean area, apply new putty tape and install back window. Water test after for leaks.
