Description: Work time for this additional job to replace a corroded wastegate linkage pin, cleaning the surfaces and installing a new turbocharger repair
Work time labor operation code 11 99 000 is not considered a Main labor operation. Also, since the “work time” FRU allowance to be claimed is specified, a separate punch time is not required. However, it still requires an explanation on the repair order and in the claim comments section.

Remove the turbocharger from the vehicle. Refer to Repair Instruction 11 65 020 Removing and installing/replacing exhaust turbocharger.

This repair instruction states to remove the entire wastegate actuator before removing the turbocharger.

When the wastegate linkage pin cannot be removed the alternate procedure in this document must be followed to remove the turbocharger and the electric wastegate actuator.

Remove both of the electric wastegate actuator Torx screws (1).

Rotate the wastegate actuator (1) upward in the direction of the arrow.

Temporarily secure the wastegate actuator in this position with a wire tie or similar fastening device.

Continue removing the turbocharger using the applicable repair instruction.

The wastegate actuator may have to be repositioned a few times during the turbocharger removal procedure.
Once the turbocharger has been removed then the corroded pin must be removed.

If you are reusing the wastegate actuator then it must be secured with wire ties (1) so that it does not get damaged during the next steps.

Modify a hacksaw blade (1) as shown using a pair of sheet metal cutters (2).

Cutting the angle on the hacksaw blade will increase access to the corroded wastegate pin.

Install the modified hacksaw blade into a suitable holder tool as shown in the illustration.
A pneumatic tool with a thin blade (1) can also be used to remove the pin.

Use the modified blade (1) to trim/remove the remaining portion of the waste gate pin.

**Important!**

*Do not damage the waste gate lever surface.*

*Damage to the surface can cause binding.*

Use a fine metal file (1) to gently remove any existing burrs.

**Important!**

*Do not damage the waste gate lever surface.*

*Damage to the surface can cause binding.*
Remove the wastegate linkage from the wastegate lever.

Inspect the wastegate lever (1) for damage.

Use a fine metal file or polishing pad as needed to remove any remaining burrs.

Continue with the repairs as described in the repair instructions.

The following steps describe the installation of the new waste gate repair clip P/N 83 30 2 456 269

Perform this portion of the repair after the turbocharger is reinstalled as per the applicable repair instructions.

Remove the M8 Torx screws from fastening set P/N 11 65 8 612 575.

Discard the small spring steel clip.

Install the wastegate actuator as per the applicable repair instruction and torque the fasteners.
Remove the wastegate repair clip P/N 83 30 2 456 269 from the package.

The clip is pre-bent (1) intentionally to place a predetermined preload on the wastegate lever and linkage. See arrows.

Do not straigten the repair clip before installation.

Install the portion of the clip with the channel onto the wastegate linkage arm (1).

Then gently rotate the eye to the center of the wastegate lever in the direction of the arrow.

Make sure the channel portion of the repair clip and linkage (1) locks together.
When the clip (1) is correctly installed it will look like the example in illustration.

The eyelet (2) must be locked in place.

Finish assembling the vehicle as per the applicable repair instructions.
