Secondary Transmission Mode Switch

Saf-T-Liner C2

It has just come to our attention that the Secondary Transmission Mode switch is not available on the DD5. This mode switch (FL-84U-001) is an optional dash mounted switch that allows the driver to switch from the transmission's default Primary Economy Mode to a Secondary Performance Mode. Because the transmission for the DD5 uses a custom shift schedule developed by Allison and Detroit, there is not an Economy and Performance mode. The shift points on the DD5 are optimized for the performance that Detroit wants from the engine which would render a mode switch ineffective.

Any DD5 unit currently on order with sales code FL-84U-001 (**Secondary Transmission Mode Switch**) will be changed to FL-84U-998 (**Transmission Mode Switch None**).

We apologize for any confusion this may cause.
