

Service Bulletin

Bulletin No.: 17-NA-051

Date: February, 2019

INFORMATION

Subject: High Oil Pressure during Initial Start of Vehicle

Brand:	Model:	Model Year:		VIN:		Engine:	Transmission:
		from	to	from	to		
Chevrolet	Silverado 2500/3500	2017	2019			L5P	All
GMC	Sierra 2500/3500						

Involved Region or Country	North America and Israel
Additional Options (RPOs)	Equipped with Diesel 6.6L Engine (RPO L5P)
Condition	Some customers may comment on high oil pressure or that the oil pressure is "pegged" high during the initial start up of the vehicle.
Cause	When first starting the engine with cold oil, the oil pressure can be up to 100 psi or 690 kPa (full range of oil pressure gauge) at idle conditions. This is normal with cold oil and internal relief valves in the engine will be active. As the engine oil temperature rises, the idle oil pressure will reduce.
Correction	This is considered a normal condition and no repairs should be performed.

Parts Information

No parts should be replaced for this condition.

Customer Information

Please communicate to the customer this condition is a normal characteristic of their vehicle. It will not impact the designed performance or reliability of the vehicle. Please share this information with the customer, including a copy of this bulletin.

Version	2
Modified	Released February 23, 2017. Revised February 06, 2019 - Added model year 2019.

GM bulletins are intended for use by professional technicians, NOT a "do-it-yourselfer". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do a job properly and safely. If a condition is described, DO NOT assume that the bulletin applies to your vehicle, or that your vehicle will have that condition. See your GM dealer for information on whether your vehicle may benefit from the information.
