If the 12-volt battery goes dead or the vehicle has an electrical or mechanical issue that keeps the transmission from shifting to Neutral, the best way to move the vehicle is with commercially available car dollies. If there aren't any available, you'll need to release the park lock (manually put the transmission into Neutral) using the procedure under Gear Shift Control Actuator Removal and Installation in the service information.

Before you start, make sure you've got the Manual Shift Lever (T/N 070AK-58H0100) handy. It's a required special tool, and you'll need it for this procedure. Then, just follow all of the steps under Removal and steps 1 and 2 under Installation.
