

## LATEST VEHICLE CONCERN FIXES

### Expected Range Predictions

#### Customer Voice:

- Vehicle does not get expected range

#### Status:

- Updated PCM software will change the minimum range value displayed in extreme ambient conditions to 201 miles in the instrument cluster. This update also dampens the range prediction response in changing conditions which provides improved accuracy of displayed driving range.
- This should only be installed if there is a valid customer complaint that has not been attributed to DTCs stored, hardware fault or drivability concerns or advised by LTS.
- Software is currently available in pathfinder and will update the PCM to software level J9D3-14C570-GAS.
