**PITSTOP — TECHNICAL OPERATIONS**

| **SUBJECT:** | HIGH BEAM ASSIST (HBA) FEATURE |
|---|---|

This Pitstop provides the procedure of enabling the High Beam Assist (HBA) feature on some 2019-2020MY Sedona (YP PE) vehicles. The HBA adjusts the headlamp intensity (between high beam and low beam) automatically depending on the brightness of oncoming vehicles and/or road conditions. <u>HBA is defaulted to OFF from the factory and needs to be enabled utilizing KDS</u>. **It cannot be enabled manually in the user settings via the instrument cluster.** Not all Sedona vehicles are equipped with HBA, however on equipped vehicles, ensure this feature is enabled; follow the procedure below.

Using KDS, select **Software Management** on the main page → select **Multi Function Camera** → select **Variant Coding** and select **OK** → select **HBA Option** to change the **HBA value** and select **OK**. A confirmation window will display once the function is complete.
