

Steering Wheel Alignment at PDI

RR Velar 18 – 20MY

Customer Voice:

- A customer may report that the steering wheel is not straight when driving straight down the road.

Technical Description:

- The steering wheel may be perceived to be out of alignment when performing a PDI due to the design layout of the instrument panel.

Status:

- Enhanced alignment instructions have been added to the Workshop Manual to guide technicians what is and is not within design specification.
- Please refer to the wheel alignment diagnosis section in TOPIx prior to making adjustments to the vehicle. If a wheel alignment is required at PDI to correct a concern, please submit an ePQR with pictures of the alignment and the before and after alignment readings.
