

Can you tell me if there is a fuse coming from the solar controller to battery bank? My Go Power screen is not displaying anything during the day. Where can I find the fuse and what amp is it? Can you send me a photo of location?

1. When you say not displaying during the day, do you mean the screen is completely blank? Or do you see a moon icon during the day?
2. Please check the wiring connection on the rood going into the entry plate. Make sure the wire connections are tight.
3. Di you have this under the driver side ottoman seat or under the power sofa? This needs to be turned ON in order for the Go Power controller to be ON.

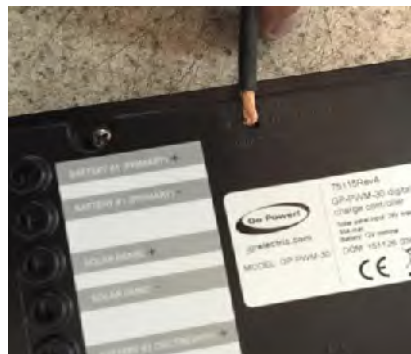

4. Attached is the location of the fuse for the solar panel. Based in our system, this coach has 2 solar panels so you have a 20amp fuse. Please replace that if needed.
5. Please also check the wiring going to the side of the Go Power Controller after replacing the fuse and the problem still exists. You need to pull it out and check the length of the wire. Follow the 2nd picture for guidance on the length.
