SERVICE BULLETIN

Re: go. / go. Max PDI

Please take note that the PDI process for both the go. and the go. Max models has recently changed.

The carburetor drain screw has been left open intentionally to ensure no fuel has been left inside the carburetor after vehicle testing at the factory.

Leaving this drain screw open helps prevent any blockages within the carburetor due to fuel sitting in the carburetor during the time between vehicle testing at the factory and vehicle delivery to dealerships.

Please close the carburetor drain screw prior to adding fuel to the vehicle.

With this additional precaution, dealers are reporting improved vehicle operation with fewer carburetor cleans required upon vehicle set-up.

Sincerely,

The Chicago Scooter Company
