assurance 5.0 shutting down Sep 23, 2020 1:48 AM

Has anyone heard from drivers on new Cascadia that assurance 5.0 just shutting down, that lane departure and cruise deactivating in the middle of driving on a route. I have been trying to understand how exactly this system works. now I have seen some inactive codes relating to VRDU communication faults as well as radar faults and a host of other ECM related faults. I also noticed when I was observing supply voltages to Side Radar and vrdu at times supply voltages in DDL8 were fluctuating at 11.80 upto 12.00V while all others were reading 12.30+. It's like this truck is got gremlins.

[SODS codes](#)

Harness is likely rubbed thru on onebox step shield.

What codes do you have? What is the last 6 of the vin?

serial MH9339 I talked to a driver who has seen it, he says he gets a Exclamation point and says it's not active, no other funny dash symbols no warnings.

Get anywhere with it? I have some codes logged with different issues. Hard to start asking for neutral (10 speed), cab losing voltage, and a few 1939 faults logged, all inactive.
