

**27-Nov-20**

LP locks out when the furnace tries to light. The furnace locks out, the spyder control says **see truma screen**. The controller reads busy. Shut off all power & waited 10 seconds. Retried & still the same message. Tech called PleasureWay to do a hard reset, of turn off furnace, turn off display, then rotary knob, then red disconnect switch. Plug. Sit 5 minutes. Then reverse.

**30-Nov-20**

Unfortunately, the furnace still doesn't turn on. It says **"See Truma Screen"** on the panel in the section for turning on the furnace and adjusting the heat setting.

The only screen that references the truma is the Settings/Diagnostics which has a blue light for the truma.

If you go to the G12 section it says that 41 furn brk is on but 32 furn trig is not.

**To run furnace:**

1. Turn on battery disconnect switch (this is what turns on your 12 volt inside coach)
2. Turn on propane switch on the outside driver side inside utility door
3. One touch screen select truma vario heat, then using the  $\frac{3}{4}$  circle adjust temperature above the room temperature (smaller numbers)

**To reset furnace:**

Turn off touch screen then turn back on again.
