Do you have the new toolbox software from Wabco? I noticed it doesn't recognize the hydraulic ABS systems. Try using the Nexiq device tester program to see if source address "11" populates under J1939. If so, sounds like an issue with the tool set up for Wabco.

Any hydraulic brake modules I've connected too, I've had to change to J1708 in toolbox and then select hydraulic brakes on the left. Are the newer modules on J1939 for diagnostics? Just curious as we don't get a lot of hydraulic brakes. Last one I worked on was 2018.

I'm pretty sure it was on j1939 but can't be for sure. The HABS program needs to be used when hooking up to Hydraulic systems though.
