2018 M2 vin KN8076 shuts down intermittently Jan 26, 2021 5:07 PM

shuts down intermittently loses all power coast to a stop usually starts right back up again of waiting a few minutes could happen once or twice a day usually after about 4 hours of driving. no codes fuel system clean I cannot duplicate this problem but when we send back out after checking everything it comes back..all battery cables tight good batteries has about 89,000 miles also checked entire harness for shorts and ignition switch connections

check your wiring under cab driver side going from bulkhead module to chassis module there is a bracket that hold the harness and the airline down has only one bolt on it look at orange wire going to chassis module i just had one that was

shorting the circuit and doing the same thing sent it out 5 times before it finally died and didn't re-start when inspected had no faults but even the icu would die and not respond when trying to isolate the issue found the issue on that harness you can see the pictures below with the bracket removed with the bracket on you cant see the short but you can see were the harness is very tight and too close to the metal not to have a problem.

please let me know if you find the same issue
