## Vehicle configuration update after the installation of wheel rims/tires of different sizes

**Sections:** 06.00 - 1 RIMS AND TIRES

**Models:** M161, M157, M156

**Description:** The rolling circumference of the tires is a parameter inserted in the vehicle configuration file contained in the car and used by different vehicle systems to adapt the related operating strategies (ie., calculation of the odometer, speedometer, identification of any slippage between the axles); so it's important to update the vehicle configuration after a replacement of the wheel rims/tires with different dimensions from those originally installed on the vehicle.

**Action:** Anytime installation of wheel rims/tires with dimensions different from those of the original equipment, it will be necessary:

- 1) Make sure that this operation is feasible (both technically and at the homologation level) by consulting the vehicle Owner's Manual or the specific vehicle Workshop Manual (0.AB.055 - WHEELS) which indicates the permitted wheel / tire dimensions.
- 2) If the operation is feasible, update the vehicle configuration file.

**Note:** Maserati will not be responsible for any anomalies or complaints caused by the failure to carry out this procedure.
