truck randomly will shut down when wet. can cycle key and no gauges swipe or anything. truck will not start. the only thing that works is the blower motor. no codes get set when it happens. it acts like the key is in the off position and after a couple of hours everything returns to normal. I found a burnt ground terminal in the chassis module and I replaced the terminal and connector but the same issue returned 2 days later.

Typically the MCM 21 pin terminals gets wet. You need to replace the seals on the 21 pin, there is a letter on it
