Connecting to ESPAR with EDITH Nov 12, 2020 3:30 AM

EDIT: 11/11/2020 Attached pdf of screen shots to follow to download, install and connect to hydronic ESPAR heater.

Can someone shoot a video or explain how to connect to the ESPAR with EDITH. This is the third truck I have tried on in a year and going on a third failure. When our shop laptop was setup with EDITH, years ago, I had no problems connecting. Now every instance Im installing it fresh and just having no luck. Hydronic Setup. KP8918.

Using the y-connector. Serial interface selected "ISO adapter auto-detection" and the light turns red, I hit ok and I think its selected the right com port. Then its just fail fail fail from there. Help seems to be so complicated.

Has anyone used EasyScan for these systems? Trying to find info for it. Specifically trying to find where these reports save to. I have only used edith.

2083.

It would be nice that Freightliner put a diagnostic connector just beside the ESPAR box, so we can plug in without having to remove ALL the stuff under the bed and then remove theses 6 bolts lying under carpet and against that small plastic separator. I told people here at service that it's a way more time diagnostic ESPAR that a simple engine fault code most of the time.

They rarely think of the technician. It is all how it assembles on the line and cost. If the need to add an extension harness that increases cost and the committee decides if the cost is needed.

I like the plain Fault Code Reader at Espar Parts.com. It is more simple to us than the EasyScan. It just breaks into the harness system.
