wabco will not connect

We have an issue with our wabco software. We have the latest updates but will not connect to any of our 2022 model year C2 buses, connects to other units just not the brand new one. We have one unit with abs light on, no dash codes, diag link does not show any abs code, does not show abs in connected module list. I'm sure if we can just get a code out of it its likely an easy fix. checked all sensor gaps, and measured sensor resistances, multiple road tests to try and clear the light but light remains on.

VIN? Have you tried Nexiq device tester? Toolbox plus?

That's a great idea. See if it talks on j1939 and j1708.

With this being a new bus first thing I'd check just because we've seen it more times than I can count. Check the fuse and power relay for pins not lock in the fuse box due to much tension pulling on harness. I say your ABS module is not powering up that why you don't see it in the call out.

Thanks for the advise, between some incorrect lap top settings and nexiq driver updates not up to date, we got it to connect to another unit, still did not connect to problem unit, all voltages and grounds and communication circuits were ok, swapped module off of good bus and it connected no problem.

only issue now is that new 2022 model abs module is not available anywhere. have been waiting almost two weeks already, hopefully one shows up soon.
