

2021 Tofino

Spyder controller was not working. It comes on and works the lights & furnace. It reads that the battery is stuck at 56%. It has an error of DC current monitor off line. The PW tech walked our tech thru the system said that we need a USB to upgrade before we can go farther. checked that the files on the thumb drive supplied from spyder were in place. went to unit. followed instructions. unit did not read thumb drive. installed new monitor (controller panel) followed screen instructions. inserted usb. completed auto update. system reset with correct vehicle id. R&R the thermistor to have proper connection at board. connected and tested ok. | _____
