04-07 MBE 4000 EGR Temperature Sensor Elimination Recall?

Does anyone remember from around 2006 what you had to change in the PLD for an MBE4000 to do away with the EGR Temperature sensor probe? There used to be a recall where you removed the sensor, installed a plug, and updated the PLD. I cannot find the documentation on this.

the recall is to just update the pld to the highest level and leave the sensor intact. you can get a plug if there is a issue with the sensor. I just did one here a year or so ago. Give it a try. after the update the temp should just be clear with no reading when you are running the unit. If I'm wrong please let me know. I cant fully remember but this is what I think I had to do.

YOU NEED TO REMOVE THE SENSOR , THE REASON FOR THE RECALL IS THAT THE SENSOR
END WOULD BREAK OFF AND GET SUCKED IN THE INTAKE,
THEN INTO ALL YOUR KITS, AND WHAT IT DIDNT CHEW UP, WENT THROUGH YOUR TURBO,
THE 900 WASNT AS PRONE TO DO THAT,

When doing this we should be going through 'Replace PLD'. Yesterday when I went through 'Update PLD Software' it would throw an error message after programming and the PLD would wipe - CEL, PLD Battery, Boost, and other engine faults and the engine would not start. This morning, I went through 'Replace PLD' and now everything is working fine. Thank ya'll for the quick responses on this! 😊
