HSA pulses on and off when brake is pressed

Hello All,

I have a 2015 Freightliner M2 112. It has just over 500k MI, Whenever I stopped at a light or waiting (foot on the brake) there is a pop (the drum brake releases and re engage) and a pulse in the break pedal. It seems to me that the HSA engages and briefly releases and comes back on there is currently no HSA light on the dash. There is no issues when start moving or such just when I stopped.

Any suggestion would greatly appreciated.
