

## 2020 Lexor

2020 Lexor: primed the generator then pressed the start button. Cranked over and stopped twice. Now will not crank over. Left it sit overnight. Primed and tried to start. Cranked over w/o starting once. Now will not crank. All fuses and breakers are good. Full tank of gas. Parked level. If it was a car, my guess would be a bad starter from the way it acts. I can hear a clicking from the fuse box area under the ottoman when I hit start and the engine doesn't. No faults listed on the control panel.

1. Have you checked the oil level of the generator? Please make sure that the oil level is exactly on the line of the dip stick because that will cause starting issues if its low.
2. Do you run the generator once a month and for how long?
3. Have you tried starting the generator directly inside the generator start/stop buttton?

The oil was good but I decided to change it while dealing with this issue. I run it every month as recommended and it does the same thing from the touch screen and at the generator.

There is actually power going to the generator so its not in the electrical system at all. Have you tried not letting go of the start button until its starts? Please contact Cummins Onan at 800-286-6467 so that they can diagnose the issue because warranty for the generator is through them. They will be able to tell where is the closest Cummins service center in your area.
