MSD Thread Subject

Challenger Driving Lights, DW Update

MSD Post Content

When adding driving lights to a Challenger a concern was identified that when the driving lights were turned on prior to going into gear the first time the driving light would shut off when the bike was put into gear the first time. The driving lights could be turned back on and would continue to function normal in or out of gear. This concern was addressed with the 07/29/2021 version of Digital Wrench (DW). Updating your DW to version 07/29/2021 (or newer) and going to Auxiliary Controllers Update, then performing the VCM3 update will eliminate this concern. After the update the driving lights will no longer shut off the first time the bike is put into gear.
