

2022 Ontour

Here's the current status:

- Images 1 and 2 show that the Spyder panel continues to show a fault.
- I removed the back rest and the top cover attached with Velcro over the DCM3. Image 3 shows that the status LED is off—no color, no blinking. Image 4 shows the status on the ~~Xantrex~~ display.
- I ran the generator for 30 minutes to ensure the batteries were fully charged. Images 5 and 6 show the display while the generator was running, and image 7 shows the status after stopping the generator.

Would you like me to disconnect the red cable now for 5 minutes as you described in your email?

No reset will be necessary on ~~this~~. The DCM3 will need to be replaced.
