

Technical Bulletin 003/21

Date: 26th March 2021

Subject: Disconnection of starter relais for transport purposes

Product: Whole Euro 5 range
Euro 4 models equipped with Lithium batteries
Euro 4 models equipped with Mobisat devices

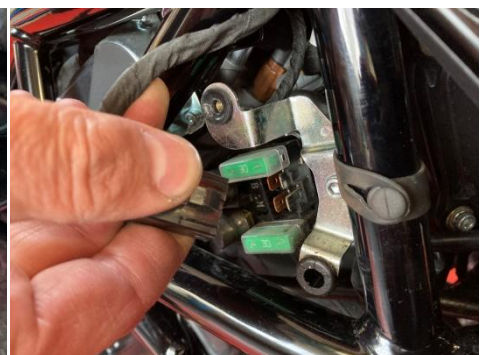

Dear Partners,

with reference to the specified models, please observe the following precaution in the below described situations.

What to do	When	Why
Disconnecting the starter relais	When the motorcycle is moved with a mean of transportation (van, trailer, train, etc...)	The movements could activate the GPS tracking devices of the motorcycle and lead to the discharge of the battery

The relay can be reconnected before the next start of the motorcycle, or to allow other operations (e.g. battery recharging, etc.).

We recommend you to inform about this precaution your customers who intend to move their motorcycles (transport by van, towing on vacation, etc.). This will allow maximum satisfaction of use in these situations.

For further details do not hesitate to contact us.

Best regards
