PROCEDURE SIRIUS ANTENNA-SOLAR PANEL PLATEAU

The black piece at the front of the panel is the Sirius XM antenna.

This should be relatively straight forward to address. The bolts on the bottom side of the panel that are not covered by sealant are in a slotted bracket and should be slid forwards at this time. Loosen the 4 bolts on the bottom side of the bracket and that will allow you to now slide the panel rearwards on the roof. Once you slid it back as far as it can, tighten down the 4 bolts to secure. This should allow enough travel to expose the antenna sufficiently and not experience further reception issues.

This should allow the panel to move back to make contact with the horizontal panel behind it. That's as far back as it can go. If it does not make contact with the panel behind, they can remove the panel and relocate the brackets in the aluminum flange.
