Secure kitchen galley at front

Below is the procedure for the squeak at the counter.

The installing supervisor said that an L-bracket needs to be installed in the lower left side of the inside of the galley just by the hose line from the fresh water (picture attached). The screws will need to be:

1. ½ inch going to the wall.
2. ¾ inch going to the floor.

Secure kitchen galley at rear

1. Remove upper drawer just below stove top.
2. Remove the farthest screw on the right side of the Induction stove.

3. Remove the left side screw of the induction stove.

4. Cut the tape under the front of the induction stove and pull out.
5. Once the induction is pulled out, on the upper right hand corner of the inside back wall of the galley very close to the perpendiucular wall, install a screw 2 ½ inches long from the galley wall going to the MB metal body frame. That will hold the galley permanently from any sway.
