

## **SSM 52680 2024 Nautilus - Driver Status Monitor Camera Off-Center**

The driver status monitor camera in some 2024 Nautilus vehicles may be positioned off-center on the top of the steering column shroud. The steering column and shrouds normally rotate back and forth due to its tilt and telescopic feature. Assure any customers who report this concern that it does not affect Blue Cruise function. If this condition occurs, do not manually twist the driver status monitor camera to center it. Telescoping the steering column out all the way out and then all the way in should center the driver status monitor camera with no repairs needed. The steering column position can then be set to the customer's preference.
