Subject: Vehicle Wide Programming

Models: Various GM Makes and Models

Vehicle Wide Programming (VWP) is a new process to update software on GM Vehicles. It provides the ability via a single selection within Techline Connect to first identify which modules need updating and then proceed to updating affected modules (with some exceptions). The updating of modules is completed in parallel instead of the technician needing to update one module at a time. This allows a more streamlined approach for dealers and customers.

When applicable, field actions will be revised to utilize vehicle wide programming. Dealers will also see new launches with this latest process in the near future.
