

ENGINE WILL CRANK AND NOT START WHEN AT OPERATING TEMPERATURE - P6

Customer Voice:

- Vehicle cranks, but does not run when at operating temperature

Technical Description:

- Lack of oil pressure causing the CVVL to not function correctly.

Status:

- Check if the vehicle was recently serviced.
- Check the oil filter for the presence of 2 O- rings as part of the preliminary diagnosis.
- See attached photo. A correct specification OEM filter is shown on the right.
- If an aftermarket filter without the O-rings is found, advise the client a correct specification JLR OEM filter is required to repair the vehicle and that JLR also recommends a further engine oil change is completed to ensure the correct JLR oil specification grade and viscosity is used.

Note: This repair will not be covered under warranty as the cause was a service from an outside repair center.
