BMS Reset

To reset the module, you need to disconnect incoming charge by turning off the red charge line disconnect and dark grey inverter master switch on the new DCD.

Then press and hold the white buttons with red centers on each battery simultaneously for 10 seconds. They are on opposite sides so you may need 2 people to do this. If you press and hold for 10 seconds and release, this will reset the BMS on both batteries.

This momentary drop in voltage during the reset is enough to reset the Trustate if no other charge voltage is coming into the DCD.

You will need to remove some of the panels to access the resets. (there are 2 screws at the front (Phillips) and 1 screw at the top (Robertson) that you'll need to remove to remove each panel, after screws are removed, panel might still be holding tight just give it a firm pull and panel should come off)

It is important that both batteries are reset simultaneously. Photo below shows the reset on the passenger side, there is another on the drivers side of the DCD.
