

Service Bulletin

Bulletin No.: PIT5985K

Date: January, 2026

PRELIMINARY INFORMATION

Subject: Diagnostic Tip: No Start/ Ignition Will Not Turn ON/ No Power Due To A CAN bus 2 Issue/Lightning Strike/ Failed Over The Air Update

Brand:	Model:	Model Year:		VIN:		Engine:	Transmission:

Involved Region or Country	North America
Condition	<p>Some technicians may experience one or more of the following concerns:</p> <ol style="list-style-type: none"> 1. No Start 2. Vehicle will not crank 3. Vehicle will not enter into Key On, Engine Off mode (Service Mode) 4. Vehicle's Instrument Panel Cluster will not illuminate 5. Vehicle will not shut Off. <p>In addition to the above concerns, when using GDS2 to connect to the vehicle, the pop up message seen below will be displayed, prompting to turn the ignition on, but the ignition can not be turned on. In some cases, after several ignition button presses, the ignition may turn on. Then, the customer or dealer technician may notice that blower motor turns on at a higher speed and then the ignition will not be able to be turn Off.</p>
Cause	This may be caused by either an issue with Can Bus 2, the vehicle received an "Over The Air" (OTA) update that has failed/ or the vehicle's electrical system was damaged by a voltage spike such as a lightning strike or an incorrect jump start procedure.

Correction

The following are some diagnostic tips to help isolate the concern:

1) Dealership technicians will notice that they are unable to access GDS data to review DTC's or check the network communication status. They may experience the following pop up box, shown below, and will be unable to get past this screen. You will need to keep hitting the continue button 5-6 times and then it will allow you to get past this screen and then it will be possible to go into vehicle diagnostics to check DTC's and CAN bus status

6278612

2) Next, use GDS2 Network Communication Status and check each CAN bus (1-9) to determine which modules are communicating and which modules are not communicating. This is similar to the Detected State feature of the Data Bus Diagnostic Tool (DBDT), but the DBDT will not work on these models. The GDS2 Network Communication Status can be found by following this GDS2 path: Vehicle Diagnosis/Vehicle Communication Diagnostics/Network Communication Status.

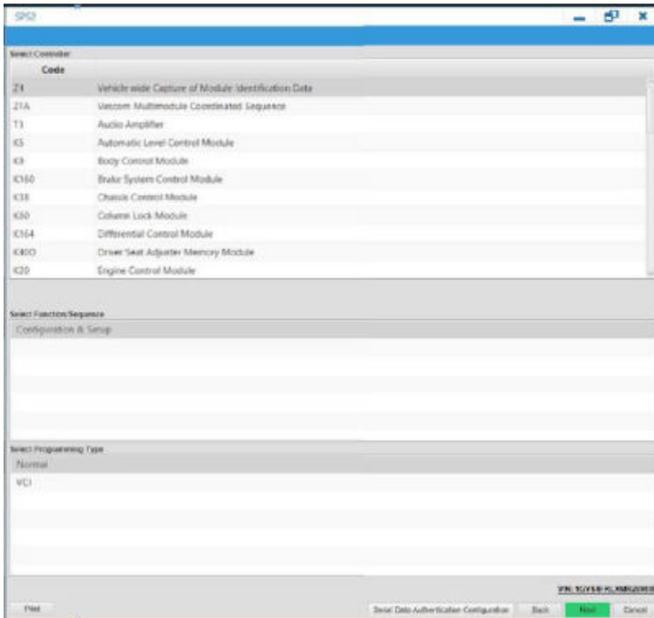

Go through each CAN bus tab (CAN bus 1-9) and note/document the communication status of each module. When switching from tab to tab you may want to wait 25-30 seconds to see if modules show up. The picture below shows an example of CAN bus 2 status.

Diagnosis and repair any modules that are not communicating. If a module fails to communicate due to a failed OTA, first try to recover the module by reprogramming the module using SPS. Then clear all DTC's and recheck for concern.

Network Communication Status		
Continuously Update Network Communication Status		
Control Module Name	Control Module Communication Status	
Engine Control Module		Communicating
Chassis Control Module - Assemblies		Communicating
Transmission Control Module		Communicating
Transfer Case Control Module		Communicating
Differential Control Module		Communicating
Brake System Control Module		Communicating
Body Control Module		Communicating
Lighting Control Module		Communicating
Immobilizer Control Module		Communicating
Parking Assist Control Module		Communicating
Image Processing Module		Communicating

6278615

3) If after all modules are communicating and you continue to have issues or current DTC: U1962, then perform a Serial Data Authentication Configuration (SDAC), which is located on the SPS controller screen in the SPS, shown below. This will have to be completed so each module recognizes each other on their respective data buses.

6278616

4) If the SDAC fails, it will attempt to run a total of 3 times. If it fails after the third attempt, an additional screen will pop up, identifying which module is causing the SDAC to fail. Be patient, as this pop-up screen may take up to 25-30 seconds to appear. Take a picture of the pop-up screen and reference the latest version of 25-NA-192

5) If the SDAC passes and a labor code is generated, make sure to clear all the U codes that are current or the vehicle still may not start.

GM bulletins are intended for use by professional technicians, NOT a "do-it-yourselfer". They are written to inform these technicians of conditions that may occur on some vehicles, or to provide information that could assist in the proper service of a vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do a job properly and safely. If a condition is described, **DO NOT** assume that the bulletin applies to your vehicle, or that your vehicle will have that condition. See your GM dealer for information on whether your vehicle may benefit from the information.
